

**4 ServiceNow  
tools/plugins/  
utilities that  
make  
debugging  
easy.**

**>>**

# **1. Evergreen Instance Analyzer**

**It's a internal store plugin which comes with a set of best practice checks that you can run on any Update Sets or your entire instance and is entirely free. One can also easily define your own rules.**

## **2. SN Utils**

**It's a browser extension that provides several features which come in handy.**

**Shows technical names, last 20 updates, helps browsing to related record(Admin role only).Helps in searching tables and open list, dictionary or schema map etc.**

### **3.Code Search**

**ServiceNow has developed a utility called "code search" (built into the ServiceNow Studio IDE interface) which helps to search a code both within and outside of your application.This is helpful whenever you're troubleshooting or just trying to understand how something works.**

## **4.Script debugger**

**The Script Debugger enables users with the script\_debugger role to debug server-side JavaScript, while the Session Log enables you to view and download required logs. One can set and remove breakpoints, pause the current session at a breakpoint evaluate expressions during runtime.**
